

FRAUD DETECTION FROM MEDICARE CLAIMS

Presented By Anvesh

Healthcare Fraud: An Unseen Epidemic Impacting Medicare's Effectiveness

- **Problem Statement**

- Healthcare fraud is a persistent issue in the US, with certain providers exploiting Medicare for personal gain. This problem limits Medicare's capacity to serve the healthcare needs of elderly and other qualifying individuals effectively.
- Despite efforts by the Centers for Medicare and Medicaid Services (CMS) to minimize fraudulent activities, identifying patterns of fraudulent claims remains a challenge.

- **Objective**

- Our goal is to examine patterns of fraudulent claims activity in the CMS Medicare dataset, using the list of fraudulent providers from LEIE.
- We aim to identify specific features distinguishing fraudulent physicians from non-fraudulent ones and develop a classifier model for fraud detection.

- **Significance**

- Addressing healthcare fraud is vital for the equitable distribution of Medicare resources, ensuring maximum reach and effectiveness of the program.
- By leveraging data analysis and machine learning, we can proactively identify potential fraud cases, thus preserving resources for those truly in need.

What can be Medicare Frauds?

Medicare fraud and abuse can occur everywhere, increasing everyone's taxes and health care expenditures. Many instances include:

- A healthcare professional charges Medicare for goods or services you never received, such as billing you for a visit or a back brace you never received.
- A provider who bills Medicare twice for a good or service you only received once.
- A person who uses your Medicare card or number to submit false claims on your behalf.
- A business that proposes a Medicare drug plan to you that Medicare hasn't approved.

CMS has released datasets, including the Medicare Provider Utilization and Payment Data: Physician and Other Supplier.

The Office of the Inspector General provides a dataset of List of Excluded Individuals and Entities (LEIE), signifying fraudulent providers.

<https://www.medicare.gov/basics/reporting-medicare-fraud-and-abuse>

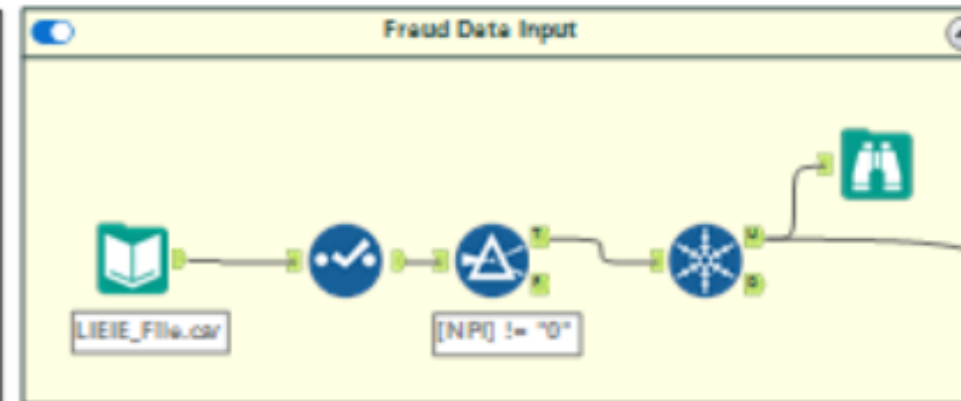

Joining the LEIE and Claims Data | Alteryx Workflow

The LEIE (List of Excluded Individuals/Entities) file contains comprehensive information about providers who have committed fraud.

Each provider is uniquely identified by their National Provider Identifier (NPI).

In this analysis, I am exclusively selecting the NPI column for further scrutiny using the Select tool in Alteryx.

Additionally, I'm employing the Filter tool to eliminate records with an NPI Code of zero, as all medicare claims data have a unique, non-zero NPI Code to identify provider.

In this phase, I am merging the Fraudulent Providers Data with the Claims Data using the "NPI" Column as the key for joining.

The 'J' Anchor of the Join tool in Alteryx outputs records that successfully matched from both the 'L' (Left) and 'R' (Right) inputs. These represent the fraudulent claims.

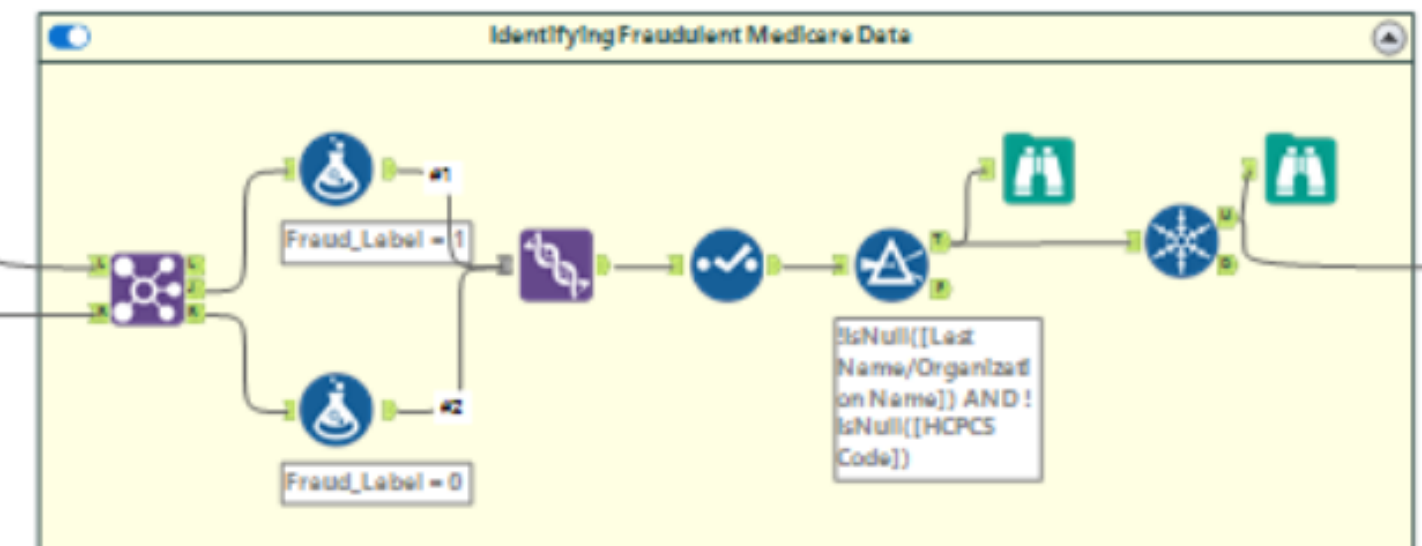

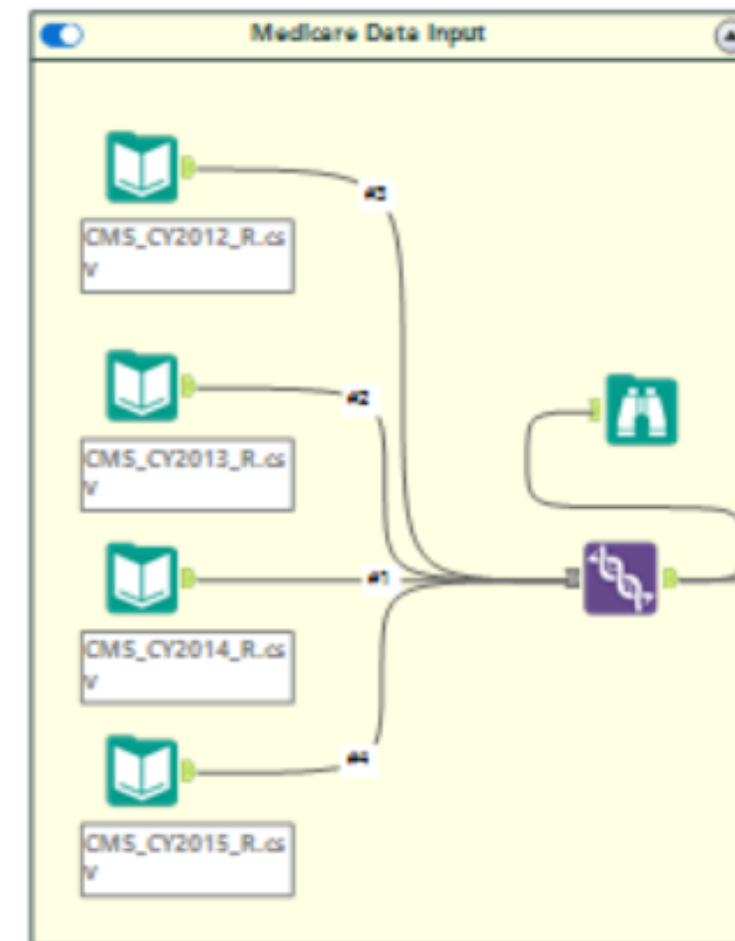

The 'R' Anchor outputs records from the 'R' input that didn't find a match in the 'L' input, signifying non-fraudulent claims.

I'm employing the Formula tool to create a new column named 'Fraud_Label'. Data stemming from the 'J' Anchor is assigned a label of 1 (indicating fraud), while data from the 'R' Anchor is assigned a label of 0 (indicating non-fraud).

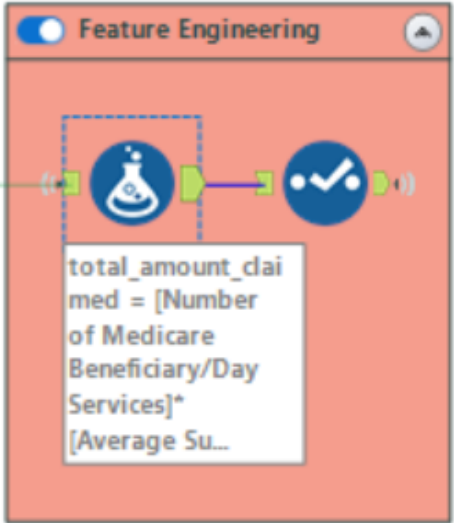

Next, I use the Union tool to combine both sets of labeled data. This is followed by removing any duplicate rows that may have been created due to the join operation.

In my dataset, multiple claims are associated with the same provider. However, for my analysis, I only require a single row per provider. To achieve this, I'm selecting unique rows based on the combination of 'NPI' and 'HCPCS' codes.

In this step, I'm utilizing the Union Tool in Alteryx to vertically stack the Medicare data files spanning the years 2012 through 2015. This process consolidates these annual datasets into a single comprehensive file for further analysis

Feature Engineering | Alteryx Workflow

The whole point of feature engineering is to capture the abnormal behavior that an medicare provider may commit. After an literature study, I found that these are important variables in the data set that can capture abnormalities.

Using the variables

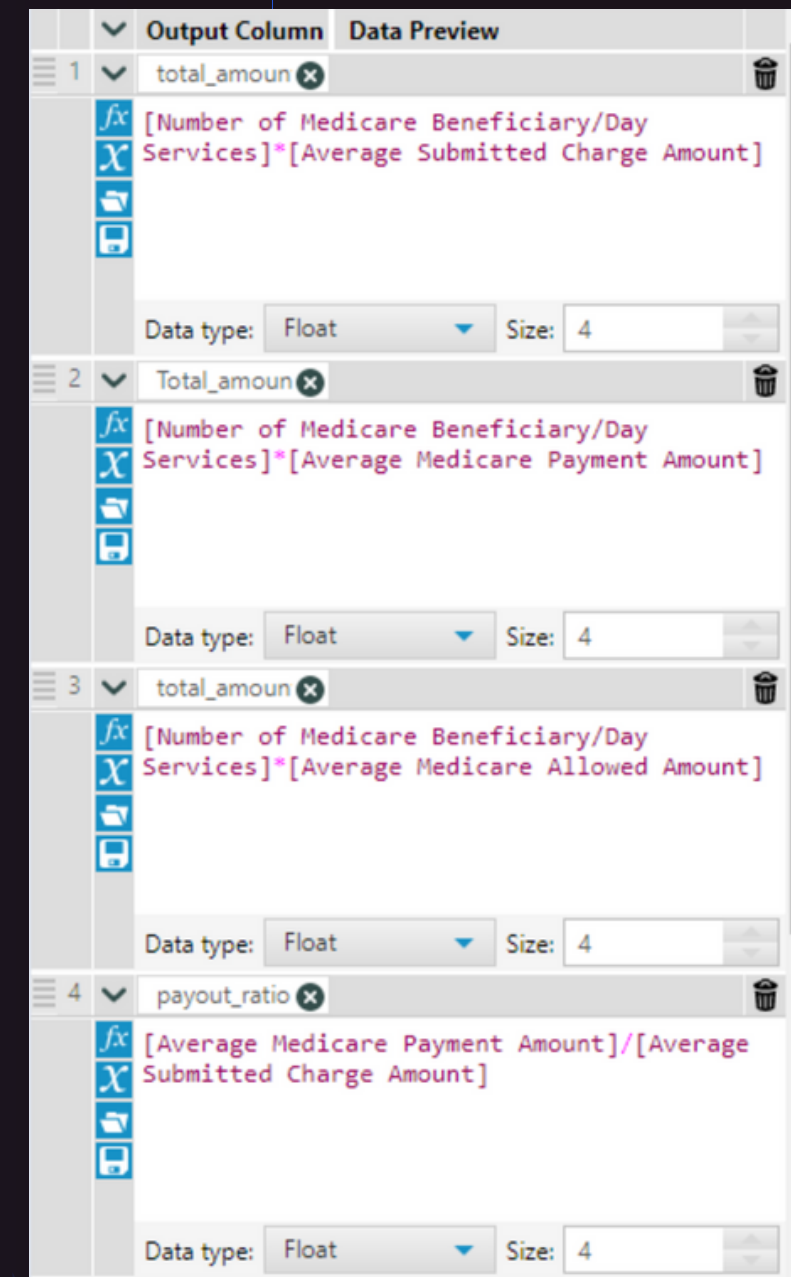

Average Medicare Amount Allowed: Average of the Medicare allowed amount for the service; this figure is the sum of the amount Medicare pays, the deductible and coinsurance amounts that the beneficiary is responsible for paying, and any amounts that a third party is responsible for paying.

Average Medicare Payment Amount: Average amount that Medicare paid after deductible and coinsurance amounts have been deducted for the line item service.

Average Submitted Charge Amount: Average of the charges that the provider submitted for the service.

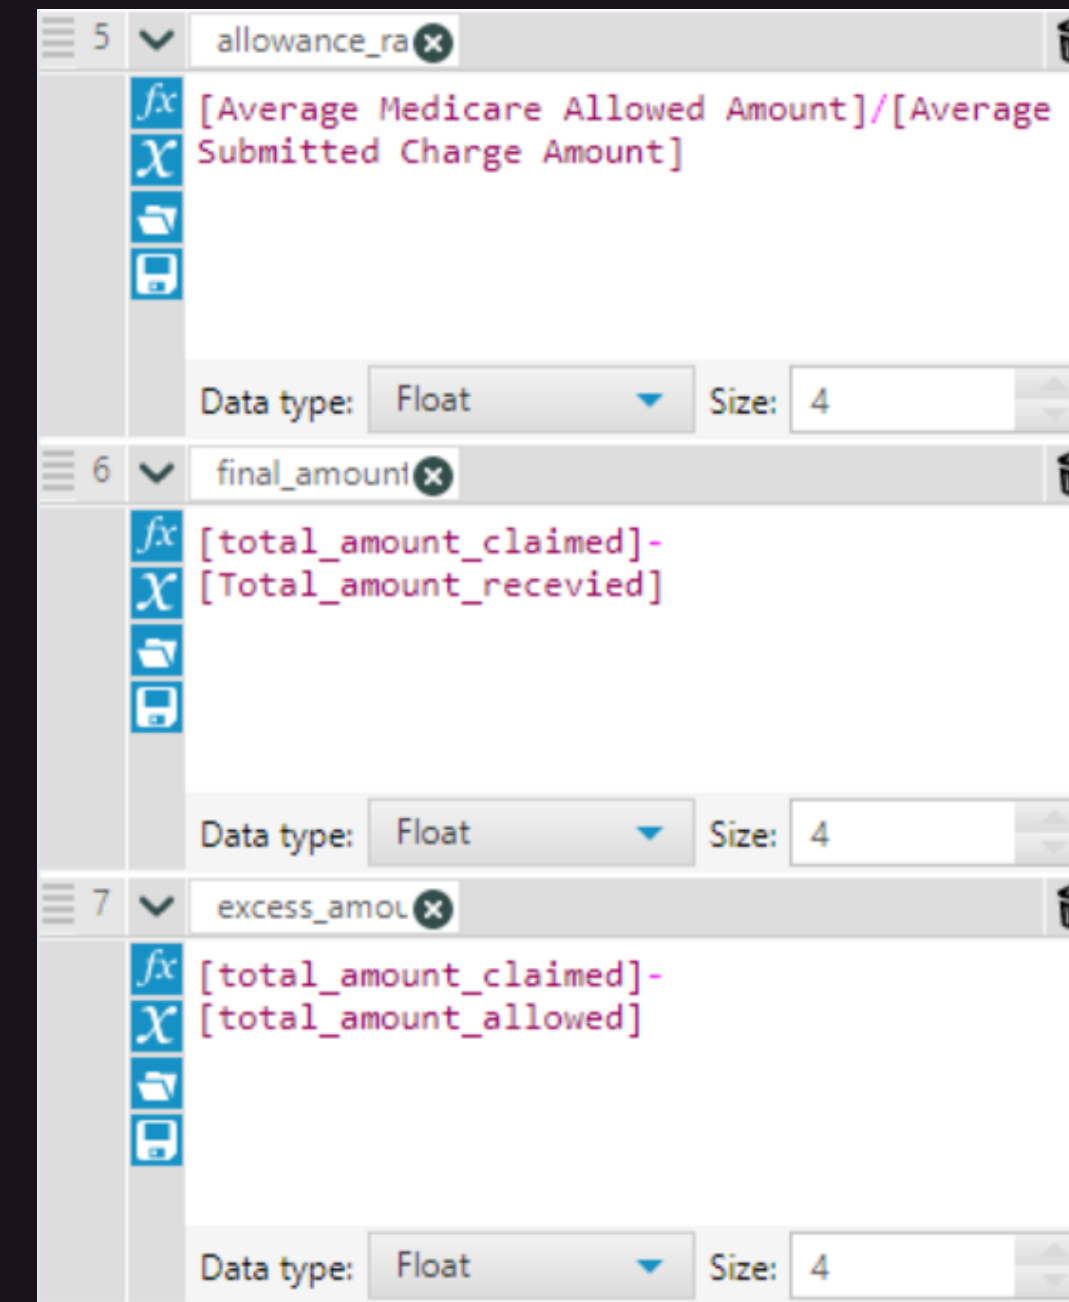

Number of Medicare Beneficiary/Day Services: Number of distinct Medicare beneficiary/per day services.

- total_amount_claimed
- Total_amount_receieved
- total_amount_allowed
- payout_ratio

Output Column	Data Preview
total_amount_claimed	$[\text{Number of Medicare Beneficiary/Day Services}] * [\text{Average Submitted Charge Amount}]$ Data type: Float, Size: 4
Total_amount_receieved	$[\text{Number of Medicare Beneficiary/Day Services}] * [\text{Average Medicare Payment Amount}]$ Data type: Float, Size: 4
total_amount_allowed	$[\text{Number of Medicare Beneficiary/Day Services}] * [\text{Average Medicare Allowed Amount}]$ Data type: Float, Size: 4
payout_ratio	$[\text{Average Medicare Payment Amount}] / [\text{Average Submitted Charge Amount}]$ Data type: Float, Size: 4

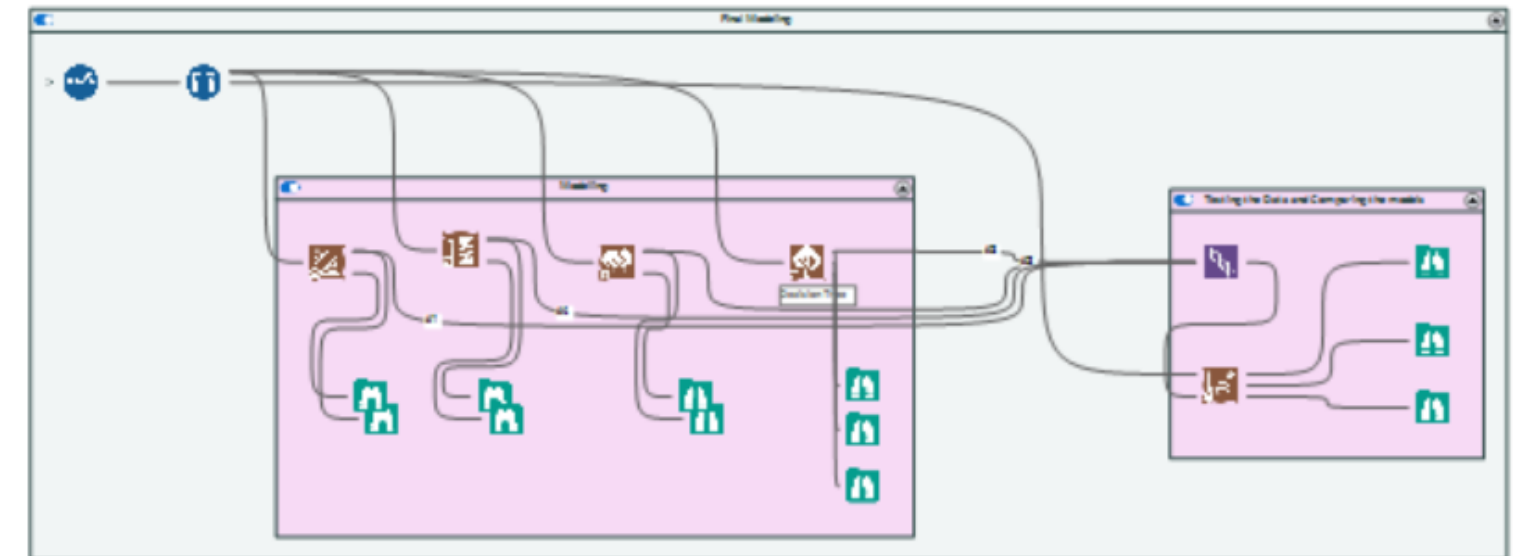

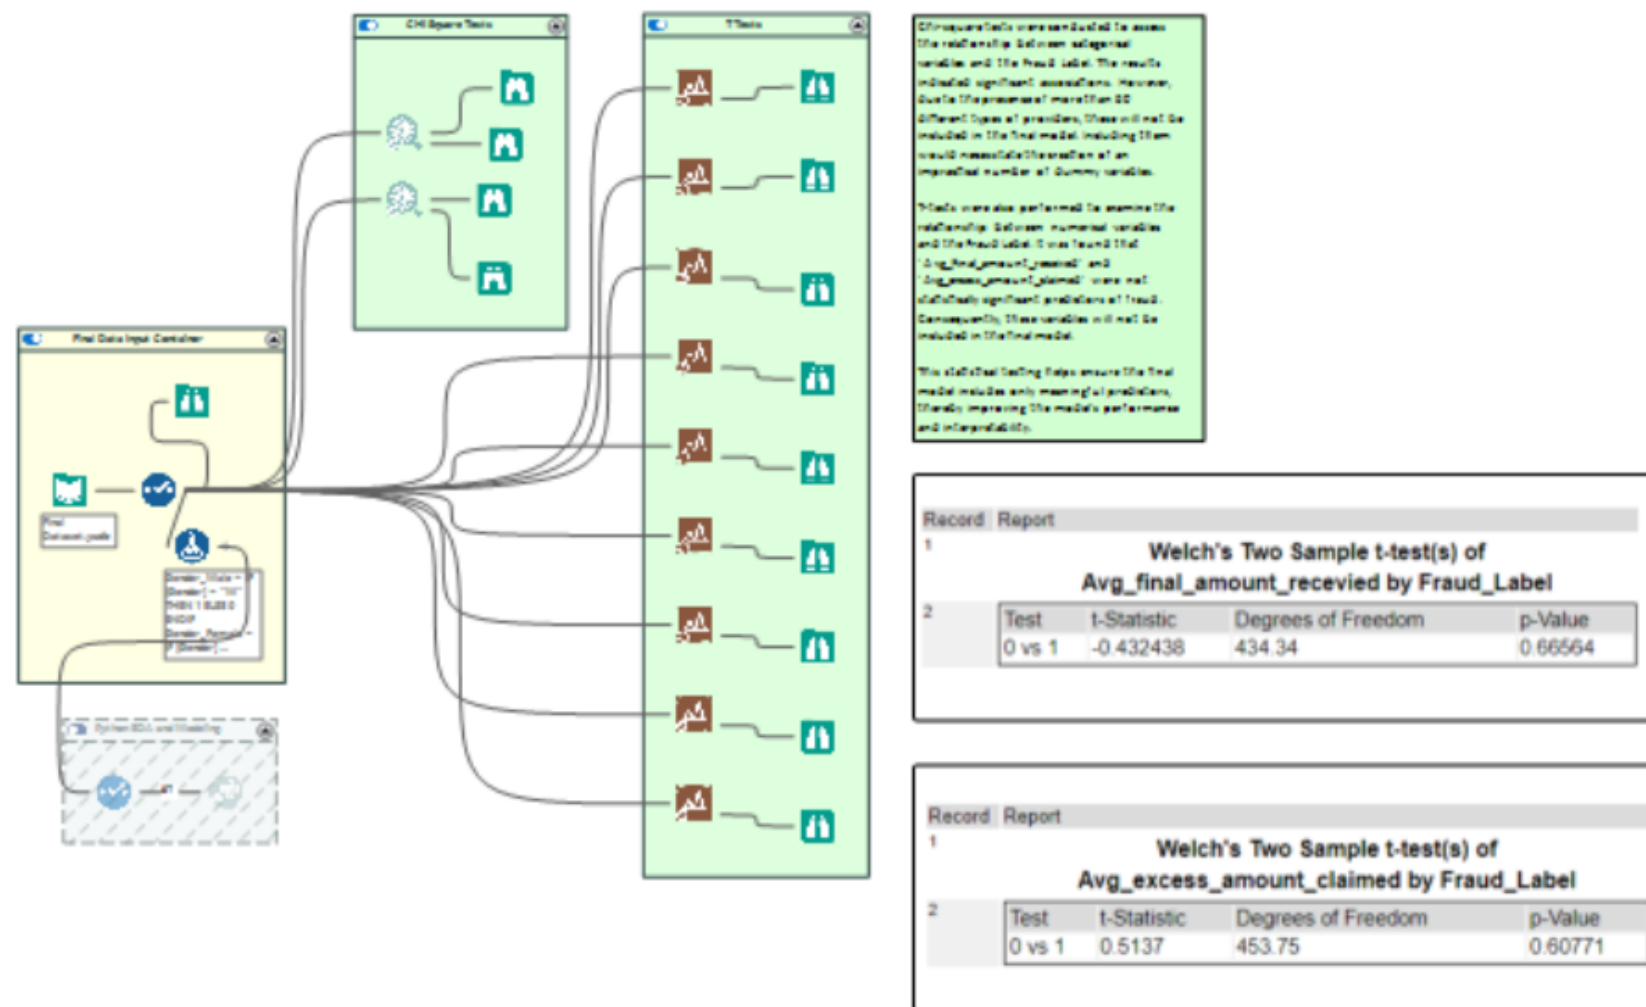

- allowance_ratio
- final_amount_receieved
- excess_amount_claimed

allowance_ratio	$[\text{Average Medicare Allowed Amount}] / [\text{Average Submitted Charge Amount}]$ Data type: Float, Size: 4
final_amount_receieved	$[\text{total_amount_claimed}] - [\text{Total_amount_receieved}]$ Data type: Float, Size: 4
excess_amount_claimed	$[\text{total_amount_claimed}] - [\text{total_amount_allowed}]$ Data type: Float, Size: 4

The whole point of feature engineering is to capture the abnormal behavior that an medicare provider may commit. After an literature study, I found that these are important variables in the data set that can capture abnormalities.

EDA and Model Building | Alteryx Workflow

Model Comparison Report					
Fit and error measures					
Model	Accuracy	F1	AUC	Accuracy_0	Accuracy_1
Support_Vector_Machine	0.7800	0.2326	0.6500	0.9573	0.1515
Random_Forest	0.7400	0.3390	0.7077	0.8632	0.3030
Decision_Tree	0.7500	0.3697	0.6568	0.8675	0.3333
Test_Model	0.7633	0.3604	0.7164	0.8932	0.3030

Model: model names in the current comparison.

Accuracy: overall accuracy, number of correct predictions of all classes divided by total sample number.

Accuracy_[class name]: accuracy of Class [class name] is defined as the number of cases that are **correctly** predicted to be Class [class name] divided by the total number of cases that actually belong to Class [class name], this measure is also known as **recall**.

AUC: area under the ROC curve, only available for two-class classification.

F1: F1 score, $2 * \text{precision} * \text{recall} / (\text{precision} + \text{recall})$. The *precision* measure is the percentage of actual members of a class that were predicted to be in that class divided by the total number of cases predicted to be in that class. In situations where there are three or more classes, average precision and average recall values across classes are used to calculate the F1 score.

1	Welch's Two Sample t-test(s) of Avg_excess_amount_claimed by Fraud_Label								
2	<table><tr><th>Test</th><th>t-Statistic</th><th>Degrees of Freedom</th><th>p-Value</th></tr><tr><td>0 vs 1</td><td>0.5137</td><td>453.75</td><td>0.60771</td></tr></table>	Test	t-Statistic	Degrees of Freedom	p-Value	0 vs 1	0.5137	453.75	0.60771
Test	t-Statistic	Degrees of Freedom	p-Value						
0 vs 1	0.5137	453.75	0.60771						

T-tests were also performed to examine the relationship between numerical variables and the Fraud Label. It was found that 'Avg_Final_amount_received' and 'Avg_excess_amount_claimed' were not statistically significant predictors of fraud. Consequently, these variables will not be included in the final model.
